入学者選抜学力試験問題

教

英　　語（前期）

〔注　　意〕

1. 監督者の指示があるまで，この冊子を開かないこと。
2. この冊子の問題は 10 ページからなる。落丁・乱丁および印刷の不鮮明な箇所などがあれば監督者に申し出て，問題冊子の交換を受けること。
3. 監督者の指示に従って，解答用紙 2 枚のそれぞれに受験番号および氏名を記入すること。
4. 解答は必ず解答用紙の指定された場所に記入すること。
5. この冊子は持ち帰ること。

〔 I 〕 Read the passage below and answer in English.

Charles the First, the son of James the First, was not a popular king, and in 1642 war began between those who wanted him to be king and those who did not. In 1649 he was killed, and England, Wales, and Scotland remained without a king until 1660, when his son Charles the Second returned to England. Charles the Second died in 1685 and his brother James became king in 1685. But James the Second was so unpopular that in 1688 he left England and was replaced by his daughter Mary and her husband William of Orange.

All these changes made people wish for order and regularity in their lives, and some people also wanted more regularity in their language. The great growth in new words between 1530 and 1660 — the fastest in the history of the language — had left people uncertain. What was happening to the language? If so many foreign and newly-made words continued to come into it, would it remain English?

Some people in England wanted to create an official organization to control the English language, similar to the Accademia della Crusca which had been started in Italy in 1582, and the Académie Française which had been started in France in 1635. One of these people was the writer Jonathan Swift, who in 1712 wrote 'A Proposal for Correcting, Improving, and Ascertaining the English Tongue' (*ascertain* here means *fix*). Swift disliked spelling changes, newly fashionable words, the habit of shortening words, and 'bad' grammar. He wanted a group of people to 'fix' the language by making grammar rules, making lists of words that were incorrect, and deciding on correct spellings.

The idea never succeeded, partly because other people realized that change in a language was (1) unavoidable. But it made people think about the need for everyone to use the same spelling and grammar. (2) (_____), different spelling guides, dictionaries, and grammar books began to appear.

Although printing had brought some regularity into spelling, many

variations had remained in the sixteenth century, even for personal names. For example, there are six known examples of Shakespeare's name that he wrote himself, and in each one he spelt his name differently. People used their own spellings, which usually showed their own pronunciation. Other variations were introduced to show that words came from Latin. For example, the letter *o* was put into *people*, the letter *b* into *doubt*, and the letter *c* into *scissors*, because the Latin words *populus*, *dubitare*, and *cisorium* had these letters. And different spellings were given to words like *sonne* (a male child) and *sunne* (the star that gives light) which sounded the same but had different meanings. In the end, this freedom to change spellings led to confusion.

In the seventeenth century, people wanted to end this confusion, and the appearance of the first English dictionaries slowly brought about more regularity in spelling. During the eighteenth century, ways of spelling that differed from these dictionaries were seen as incorrect and a sign of stupidity or a bad education. Even today, many people do not like making spelling mistakes, and often use the spellcheck tool on their computers.

Dictionaries were not unknown before the seventeenth century, but they were Latin–English ones. The first English–English dictionary appeared in 1604 and was written by a schoolteacher called Robert Cawdrey. It was called *A Table Alphabeticall* and was a list of about 2, 500 'hard vsuall English wordes' with explanations of their meaning and sometimes which language they had come from — French (fr) or Greek (gr). Here are some examples of the words in the *Table*:

(*fr*) *accomplish*, finish, or make an end of;
barbarian, a rude person;
eclipse (*gr*), a failing of the light of the sunne or moone;
obsolete, olde, past date, growne out of vse or custome;

A Table Alphabeticall became very popular and similar dictionaries followed. In the eighteenth century dictionary writers began explaining more ordinary words, not just difficult ones.

In 1746 a group of booksellers asked a young writer called Samuel Johnson to prepare an English dictionary. Johnson worked on this dictionary for nine years, with the help of six other people. For three years he read the works of hundreds of English writers and found examples for words in the dictionary. Then he began to write the meanings of the words. He chose 'hard' words but also many ordinary ones.

When Johnson's *A Dictionary of the English Language* appeared in 1755 it was an immediate success. It explained more than 42, 000 words, and as well as the meaning of each word, it gave the pronunciation and history of the word, and sometimes how it was used. A 'cant' word was used only by one group; a 'low' word was informal and not suitable for writing. Johnson gave (3) ( ) ( ) ( ) ( ) of a word ( ) ( ) ( ). He very often gave an example from literature to show how the word was used. In fact, there are about 114, 000 examples in the dictionary, and they are a very large part of it. Most of them come from literature written between 1560 and 1660.

Here are some examples of words and their meanings from Johnson's *Dictionary*:

to búbble To cheat: a cant word.

to nab [*nappa*, Swedish.] To catch unexpectedly; to seize without warning. A word seldom used but in low language.

wóman [*wifman*, *wimman*, Saxon; whence we yet pronounce women in the plural, *wimmen*.] The female of the human race.

That man who hath a tongue is no man,
If with his tongue he cannot win a woman.
Shakespeare.

yéllowboy A gold coin. A very low word.

To búbble and *yéllowboy* have both disappeared from English, but *to nab* has survived, with this meaning. It is still an informal word.

The dictionary was not perfect: some of Johnson's explanations were harder to understand than the words themselves, some expressed his personal opinions, and some words were not listed because he disliked them. Also he could not fit in all his examples, so words at the end of the dictionary have fewer examples than those at the beginning. However, it remained the most important English dictionary in Britain for more than a century.

〔設問 1〕 What is the main idea of the passage?

A. Early dictionaries were unpopular.

B. Inconsistent spelling and grammar bother people.

C. The English language contains many variations of words.

D. Early dictionaries helped to make the English language more consistent.

〔設問 2〕 Why was the Accademia della Crusca created?

〔設問 3〕 Which one of the following is closest in meaning to (1)?

A. indifferent

B. inevitable

C. precise

D. preventable

〔設問 4〕 Which one of the following is appropriate for (2)?

A. As a result

B. In contrast

C. Moreover

D. Otherwise

〔設問 5〕 How did dictionaries change in the eighteenth century?

A. They became alphabetized.

B. They became easier to use.

C. They began to include more common words.

D. They began to include word origins.

〔設問 6〕 Complete (3) using the words in the box.

Johnson gave (　　) (　　) (　　) (　　) of a word (　　) (　　) (　　).

as / as / could / different / he / many / meanings

〔設問 7〕 According to *A Dictionary of the English Language*, which words were inappropriate in writing? Choose two correct answers.

A. to búbble

B. to nab

C. wóman

D. yéllowboy

〔設問 8〕 Arrange the following events in the order in which they occurred.

A. The Académie Française was established.

B. The first English-English dictionary was published.

C. Charles the Second died.

D. Samuel Johnson began to make an English dictionary.

E. Jonathan Swift wrote 'A Proposal for Correcting, Improving, and Ascertaining the English Tongue.'

(　　)→(　　)→(　　)→(　　)→(　　)

〔II〕 Read the passage below and answer in English.

The world is wasting food on a scale that must be described as excessive, inexcusable, and, given (1) all of our other concerns about the state of the global environment and quality of human life, outright incomprehensible. The UN's Food and Agricultural Organization puts the annual global losses at 40–50 percent for root crops, fruits, and vegetables, 35 percent for fish, 30 percent for cereals, and 20 percent for oilseeds, meat, and dairy products. This means that, globally, at least one-third of all harvested food is wasted.

Reasons for wasting food differ (2). In the poorest countries it is most often because of poor storage (as rodents*, insects, and fungi feast* on improperly stored seeds, vegetables, and fruits) or lack of refrigeration (causing rapid spoilage of meat, fish, and dairy products). That is why in sub-Saharan Africa, most waste takes place even before the food reaches consumers. In the affluent world, however, the main cause is simply the gap between excessive production and actual consumption: despite their high frequency of overeating, most high-income nations provide their citizens with a food supply that would be, on average, adequate for hard-working lumberjacks* or coal miners, not for largely sedentary* and aging populations.

Not surprisingly, the United States is a leading offender, and we have plenty of information to quantify the excess. Average daily food supply in the US comes to about 3,600 kilocalories per person. That's supply, not consumption — and a good thing, too.

Consider that if you omit babies and housebound octogenarians*, whose daily requirements are less than 1,500 kilocalories, that would leave more than 4,000 kilocalories available for adults: Americans may eat too much, but they could not all eat that much every day. The United States Department of Agriculture (USDA) adjusts these figures for "spoilage and other waste," and puts the actual daily average available for consumption at about 2,600

kilocalories per person. But even that isn't quite right. Both surveys of self-reported food consumption (carried out by the National Health and Nutrition Examination Survey) and calculations based on expected metabolic requirements* indicate that the actual average daily intake in the United States comes to about 2,100 kilocalories per person. Subtract 2,100 kcal/capita of intake from 3,600 kcal/capita of supply and you get a loss of 1,500 kcal/capita, which means about 40 percent of American food goes to waste.

This was not always the case. In the early 1970s, the USDA put the average food availability per capita (adjusted for pre-retail waste) at less than 2,100 kilocalories per day, nearly 25 percent less than it is now. The National Institute of Diabetes and Digestive and Kidney Diseases estimates that the United States' per capita food waste increased by 50 percent between 1974 and 2005, and that the problem has gotten worse since then.

But even if the average US daily loss had remained at 1,500 kilocalories per capita, a simple calculation shows that in 2020 (with about 333 million people) this wasted food could have provided adequate nutrition (2,200 kilocalories per capita) to about 230 million people, slightly more than the entire population of Brazil, Latin America's largest nation and the world's sixth-most populous country.

Yet even as they waste food, (3) Americans are still (　　) (　　) (　　) (　　) (　　) than is good for them. The prevalence of obesity — defined as a body mass index of 30 or greater — more than doubled between 1962 and 2010, rising from 13.4 percent to 35.7 percent among adults over age 20. Add to this number the merely overweight (a BMI between 25 and 30) and you find that, among adults, 74 percent of males and 64 percent of females have an excessively high weight. Most worrisome, as obesity is usually a lifelong condition, that proportion is now above 50 percent for children above the age of six as well.

The UK's Waste and Resources Action Programme (WRAP) provides

different perspectives by tracing the phenomenon in unusual detail. In Britain, total food waste amounts to about 10 million tons a year and it is worth about £15 billion (or nearly $20 billion), but inedible parts (skins, peelings, bones) make up only 30 percent of that total — so 70 percent of wasted food could have been eaten! WRAP also documented the whys of the process: nearly 30 percent of the waste is due to "not being used in time," a third because of the expiration of "best before" dates, about 15 percent because too much was cooked or served, and the rest is due to other reasons, including personal preferences, fussy eating, and accidents.

Food loss goes beyond the wasted nutrition, however — it entails* a significant waste of labor and energy used directly to operate field machinery and irrigation pumps, and indirectly to produce the steel, aluminum, and plastics needed to make those mechanical inputs and to synthesize fertilizers and pesticides. The extra agricultural effort also ends up hurting the environment by causing soil erosion, nitrate leaching*, the loss of biodiversity, and the growth of antibiotic-resistant bacteria; and the production of wasted food may be responsible for as much as 10 percent of global greenhouse gas emissions.

Affluent countries need to produce considerably less food and consume it with considerably less waste. And yet the mantra of higher food production is chanted as loudly as ever. Its most recent variation is to produce more by eventually flooding the markets with fake meat made from altered legume proteins. Instead, why not try to find clever ways to reduce food waste to a more acceptable level of loss? Cutting food waste in half would lead the way to a more rational use of food worldwide, and the benefits could be huge: WRAP estimates that a dollar invested in food waste prevention has a 14-fold return in associated benefits. Is this not persuasive enough?

出典：Vaclav Smil, *Numbers Don't Lie: 71 Things You Need to Know About the World*（一部改変）

（注） rodents：ネズミなどの齧歯（げっし）類

fungi feast：菌類の繁殖

lumberjacks：木こり

sedentary：座ったままであまり活動的でない

octogenarians：80 代の人

metabolic requirements：代謝性要求（ヒトが活動するのに必要なエネルギー量）

entail：伴う

nitrate leaching：硝酸塩浸出

〔設問 1〕 What is the best title for this passage?

A. Food Supply in Affluent Countries

B. The Loss of Biodiversity in the World

C. The Magnitude of Global Food Waste

D. Average Daily Food Requirements

〔設問 2〕 Which one of the following is closest in meaning to (1)?

A. providing

B. considering

C. solving

D. receiving

〔設問 3〕 Regarding (2), what is the main reason in affluent countries?

〔設問 4〕 How many kilocalories does the average person in the US consume every day?

A. about 1,500

B. about 2,100

C. about 2,600

D. about 3,600

〔設問 5〕 Complete (3) using the words in the box.

Americans are still (　　) (　　) (　　) (　　) (　　) than is good for them.

eating / more / far / it / of

〔設問 6〕 According to the passage, why is the proportion of obesity in children especially problematic?

〔設問 7〕 According to WRAP, how many tons of wasted food could have been eaten in Britain per year?

〔設問 8〕 What does the passage NOT mention is an effect of food waste?

A. increase in obesity

B. damage to the planet

C. waste of labor and energy

D. increase in antibiotic-resistant bacteria

〔設問 9〕 Which statement would the author probably agree with?

A. People should buy fake meat in stores.

B. People should donate a dollar to WRAP.

C. People should use food more sensibly.

D. People should consume altered legume proteins.
