On May 11, 1869, America's first train set out from California heading to the East Coast. That day, its cargo was a load of Japanese green tea. Today, only 15 percent of the tea (　1　) annually in the United States is green, and the vast majority of that is produced in countries like China and Vietnam. But at the end of the 19th century, America's tea of choice was green, and Japan was the major supplier.

In his book *Green with Milk and Sugar: When Japan Filled America's Teacups*, history professor Robert Hellyer shares this little-known fact. "Green tea was the most popular tea in the U.S. since right after the Revolutionary War, but there are different theories (　a　) why," he says. One theory is that the green tea that flooded the U.S. in the colonial era may have been "leftovers" from the tea grown in China and imported by the British East India Company after the best tea went to British consumers. "But Americans started to really like green tea, and see it as more sophisticated," says Hellyer.

In the 18th and early 19th centuries, China held a global monopoly on the tea trade, and key information about tea cultivation and production was (　2　) secret. 1) It wasn't until 1843 that Europeans found out that green and black teas come from the same plant. In the 1840s, the British secretly took tea plants out of China and (　b　) colonial India, where they would eventually establish a rival tea industry. But even before British-grown tea became a major commodity in India, Japan entered the global tea market in the 1860s.

Hellyer cites the Meiji Restoration as the most significant factor in Japan for establishing a tea trade of their own. This revolution resulted in a major restructuring of power. "In the new regime, there are groups in Japan who see it as important to export tea to the West," says Hellyer. 2) Some of the individuals involved in this new booming trade were Japanese samurai who became tea farmers after the Meiji Restoration, and Hellyer's own American ancestors who

worked in the tea export business.

Japanese traders took advantage of direct sea routes to Seattle and San Francisco, and the United States became the biggest market for Japanese-grown tea. "By about 1880, Japan had about 40 percent of the U.S. market," says Hellyer. The Midwest was known to consume the most green tea of any region. "In the Midwest, green tea really became popular from the 1870s and 1880s," says Hellyer. "That's a moment where there's a lot of economic growth in the Midwest. And the people there are (3) wealthy, but as they develop new cultures, they are using the established culture of tea to show their wealth."

Japanese merchants promoted their product in the United States with elegantly-designed labels and advertisements that presented an image of Japan (c) refined, artistic, and non-threatening. Yet by the 1920s, another major shift in America's tea habits had (4). Black tea grown in British India started to replace Japanese green tea as America's preference. In his book, Hellyer notes that this was due to a combination of socio-economic factors and increasing anti-Japanese sentiment. Marketing played an important role, as merchants seeking to block non-British teas (d) the market used racist imagery in their advertisements, portraying both the Chinese and Japanese, as well as their teas, as inferior and unhygienic.

The shift in the American tea market changed Japan's tea market as well. While Japanese tea drinkers have always preferred green (e) black, "in the past, it was a lower grade of green tea, called *bancha*" that was the most popular in Japan, Hellyer explains. *Bancha* was cheaper and had a more brownish color when brewed. With Americans (5) interest in green tea, Japanese merchants with a newfound surplus of expensive tea started marketing it aggressively in their home country. This created an increased demand in Japan for the fine, high-grade green tea that is still popular today.

Ⅱ　次の英文を読んで，以下の問いに日本語で答えなさい。(配点率　30 %)

There's a good chance that some of your beliefs have been influenced by animated movies. The generation now growing up were raised on huge numbers of animations as children. But has Disney's mix of morals, stereotypes and magic had lasting impact on this generation of adults who watched these films as children?

At first sight, these films are harmless entertainment, but some researchers have raised concerns about the unconscious lessons Disney's films contain. Perhaps the most common criticism is the way these have portrayed gender, racial and cultural stereotypes in the past. The opening song "Arabian Nights," in *Aladdin*, for example, originally contained the line "where they cut off your ear if they don't like your face" when it was released in 1993. After this was criticized for being racist, Disney changed the lyric.

The portrayal of women has also been problematic depending on the time. Some researchers divide the corporation's portrayal of women into distinct eras. First came the domestic era, when female characters like *Snow White, Sleeping Beauty* and *Cinderella* were portrayed as homemakers, often cleaning and in need of rescue by a man. Then came the rebellious era of Ariel in *The Little Mermaid*, Princess Jasmine in *Aladdin*, and the heroines in *Pocahontas* and *Mulan*. During this period, Disney's women seemed to gain more independence, striving to free themselves from social expectations.

But Ariel also sacrifices her voice in order to be with the man she loves. "The symbolism here is powerful," wrote Mia Adessa Towbin, a researcher of family studies. "To win the love of the prince, she must give up her thoughts and intellect, as well as her independence and identity."

The Little Mermaid and other films also show another trend — the female characters start to speak less. Despite being the title characters, women speak just 32% of the time in *The Little Mermaid*, while they have just 24% of lines in

Pocahontas and 23% in *Mulan*. In *Aladdin*, female characters have just 10% of the speaking time. Furthermore, male characters in the same films tended to order the female characters around far more than the other way around. Women were also more polite than the men.

Gender isn't the only problem some see with Disney films, however. Disney has also faced criticism over its treatment of mental health — 85% of Disney's 34 animated films released before 2004 mentioned mental illness, often used in negative ways. Depictions of gender and mental health in Disney films can have a big impact on the children who watch them because they reinforce stereotypes. Additionally, research has shown that watching Disney princesses was associated with greater female gender-stereotype behaviour and lower body self-esteem later.

But there are many potential positive effects from Disney's films, too. One study showed that watching Disney characters help one another inspired children to help their own friends. Another study revealed that Disney films are rich in socially beneficial behaviour, such as sharing, helping others, or offering compliments or encouragement.

More recently, there are additional positive trends from Disney. The female characters in *Frozen*, *Brave* and *Moana* represent a new era of Disney. They are strong and in control of their own lives and no longer need male characters to save them. Perhaps most welcome are the recent remakes of the older classic Disney animations such as *The Little Mermaid*, *Aladdin* and the upcoming *Mulan*, all featuring actors of color. "The company is attempting to keep up with the times with reference to gender equality and representation," says Ingvild Kvale Sørenssen, who studies children's relationships with Disney. "Representation matters, diversity matters. And being able to dream and imagine oneself a character is not a bad thing."

"Did Disney shape how you see the world?" *BBC*, August 1, 2019. 一部抜粋・加筆修正

Ⅲ　次の英文の内容を 150 ～ 180 字の日本語で要約しなさい。（配点率　20 %）

Walking is one of the most popular forms of exercise worldwide. It doesn't require expensive equipment or special skills, and it provides a wide range of health benefits, both physical and psychological. Whether you walk on an outdoor path in nature, a busy route on city streets, a gym workout, or a few rounds around your office building, walking is a relatively accessible way to stay active and improve your physical and mental health.

The physical health benefits are clear. Walking is a type of physical activity which increases your heart rate. Fast walking is considered a moderate, low-impact exercise that does not put too much strain on joints (hip, knee, ankles) that are easy to injure with higher-impact exercise. It lowers the risk of diabetes, stroke, and heart disease. It is therefore effective in preventing many lifestyle diseases, and because of increased blood flow, it can actually improve your energy levels. Furthermore, anyone can do it because walking speed, length of time, and frequency can be adjusted depending on a person's starting fitness level.

People may think that walking is not as effective as higher-impact workouts. Yet a large study of runners and walkers found that after 6 years of follow-up, when expending an equal amount of energy, moderate exercise had similar benefits to harder exercise in reducing the risk of high blood pressure, high cholesterol, and diabetes. But, while some studies confirm that taking more steps is good, the exact amount to see a health benefit will vary among individuals. The guideline from the *Centers for Disease Control and Prevention to "move more and sit less throughout the day; some physical activity is better than none" remains an appropriate goal for everyone.

If walking is your exercise of choice, a typical routine may start like this: athletic shoes on, earbuds in, upbeat music playing, walking path determined. Your main goal is to complete a certain number of steps or length of time. Many people focus on such measurable physical fitness goals.

The physical fitness benefits are clear, but what you may not realize is that walking also offers mental health benefits. These come from increasing our awareness of the sights and sounds that are beyond our *pedometer and music playlist. An example might be looking at nature (trees, flowers, clouds) or paying attention to people or events happening as we walk past. Some studies have found that walking in nature, such as in a forest or alongside a river, can decrease negative moods like depression, anxiety, anger, fatigue, and confusion.
