2. この問題冊子は42ページある。印刷不鮮明の箇所などがある場合には，監督者に申し出ること。
3. **解答**はそれぞれ指定の解答用紙に**横書き**で記入すること(国語は除く)。
4. 解答用紙の指定欄には必ず**受験番号**を記入すること。
5. 解答用紙の評点欄には何も記入しないこと。
6. 解答用紙は持ち帰らないこと。

英語コミュニケーションⅠ・Ⅱ・Ⅲ，論理・表現Ⅰ・Ⅱ・Ⅲ

Ⅰ 次の英文を読み，設問に答えなさい。

The population of the United States is far better educated today than it has ever been, and by some measures, that's a national success story. In 1971, only 12 percent of adults aged twenty-five years and older held a bachelor's degree or higher. By 2012, that proportion had increased to 31 percent. During that same period, the percentage of adults who had finished at least some college increased from 22 to 57 percent. The pipeline to college is also expanding, as rates of high-school completion have been rising; between 1971 and 2012, the proportion of the U.S. adult population who had completed high school increased from 57 to 88 percent.

While these gains are notable, they have also been uneven across income levels, racial and ethnic lines, and sexes, and according to several experts, those inequities have been increasing. America has become a more diverse society, but (1) higher-education attainment has not kept pace.

Nearly twenty million people now attend college in the United States — more than sixteen million of them undergraduates and the rest pursuing advanced degrees. In popular culture, the "typical college student" is a young person who enrolls right out of high school at a four-year residential college. (2) The reality, however, is a lot different. For one, many of those attending college today are not full-time students. In fact, about 37 percent of all undergraduates attend part-time. (At community colleges, nearly six of ten students attend on a part-time basis.) Most of those who attend part-time do so because they also work — and some of them work a lot. Nearly a third of all undergraduates work thirty-five hours a week or more. Many also have family responsibilities; nearly a quarter of them are parents, and more than

one in eight is a single parent.

The "typical" college student is also aging. More than a third of college students are aged twenty-five years and older, and that population of students has been growing at a faster rate than the number of younger students. (3)This pattern is projected to continue, in part because colleges face a decline in high-school graduates over the next few years and, as a result, will focus more on recruiting older students. Changes in the economy and high unemployment rates may also prompt adults to start or return to college for additional training and certificates.

Recently, however, that has not been the case. (4)Between fall 2011 and fall 2013, college enrollment dropped, particularly among older students. Analysts speculate that with the economy improving, some of those adults were choosing work over school. For the decade ending in 2021, the National Center for Education Statistics has predicted a 13-percent increase in enrollments of students younger than twenty-five years and a rise of 14 percent in the enrollment of students aged twenty-five years and older. By 2021, it predicts that students older than twenty-five will compose about 42 percent of the college population.

設問 1 下線部(1)となっているのはなぜか，本文に基づいて具体的に日本語で説明しなさい。

設問 2 下線部(2)の例を，本文に基づいて具体的に日本語で説明しなさい。

設問 3 下線部(3)について，本文に基づいて具体的に日本語で説明しなさい。

設問 4 下線部(4)に至った要因を，本文に基づいて具体的に日本語で説明しなさい。

II 次の英文を読み，設問に答えなさい。

As a teacher or anyone who works with language learners knows, language learners make a lot of mistakes. This applies to children as well as adults. Today I told my four-year-old that we were having spaghetti for dinner and he said, *psghetti?* Just for the fun of it, I said, *No, it's not psghetti. Say spa-ge-ti.* He, being a lovely and compliant child, said *psghetti.* He also at four still uses *me* instead of *I* as the subject of most of his sentences, saying things like, *Me didn't play with Kay today.* My older children have corrected him numerous times, and sometimes he does repeat his mistaken sentence with the correct subject, but after a few sentences, he will revert back to the mistaken one.(1) Children make adorable mistakes when they are learning to speak a language that seem cute because we know they will eventually outgrow them.

Adult mistakes don't seem nearly as cute, and it's clear that second language learners never outgrow some of the mistakes that they make. But is that because no one has ever corrected them? A very common mistake for Japanese learners of English is to not include a necessary object after a verb. For example, if I asked students about their weekends, someone might say something like, *I saw a movie. I very enjoyed.* I have corrected students who have used this phrase, and some students repeat the correction after I give it (*I enjoyed IT*) while others just nod. Later, I have heard the same incorrect phrase(2) from the same student. Another example of a mistake with using the correct verb and object is the phrase *Let's English*, which means *Let's speak English.* This mistake is actually printed on advertisements for English conversation schools in Japan. As a teacher, I have to admit that sometimes I just give up and say, *OK, let's English!* Corrections seem to do no good in some cases.

On the other hand, some corrections do seem to sink in. Teaching a group of students at Kyushu University this semester, I told them that when they are talking about a list of things, that it might sound more natural in speaking to

use the phrase *and things like that* instead of *so on*. Here is an example of what one student said that I thought would sound better with the phrase *and things like that*:

> Today cell phones have many functions. For example, listening to music, sending email, telephone, and so on.

The students listened to what I had to say(3), and here is what another student then said, also about his cell phone:

> But I don't use cell phone when I in theater and in class things like that.

Obviously the phrase *OR PLACES like that* would have sounded more natural here. My point here is that students sometimes do take corrections and remember them, but in some cases those corrections don't work quite the way we think they will(4). And it seems a rule that students will remember perfectly *whatever* you tell them about naughty words in your language.

＊以下の各設問を解答する際，本文中のイタリック体は抜き出してもよい。

設問 1 下線部(1)の具体的な内容を，本文に基づいて日本語で説明しなさい。

設問 2 下線部(2)の具体的な内容を，本文に基づいて日本語で説明しなさい。

設問 3 下線部(3)の具体的な内容を，本文に基づいて日本語で説明しなさい。

設問 4 下線部(4)について，著者がこのように考えた理由を，本文に基づいて日本語で説明しなさい。

Ⅲ 次の英文を読み，設問に答えなさい。

First of all, it is useful to distinguish (1) language as a general concept from (2) individual languages. Our definition of linguistics makes reference to this general concept and, as such, tells us that linguistics is concerned with this general concept rather than with the study of individual languages. It is very difficult to give an adequate general definition of language, especially in advance of the first steps in constructing any kind of theory of language or its subparts. For the moment, let us define language as the communicative and cognitive capacity that, as far as we know, most clearly distinguishes humans from other animals. All human societies and cultures that have ever been discovered have language, most commonly spoken language; current estimates are that there are over 7,000 languages spoken in the world, although individual languages are hard to count. On the other hand, no non-human animal has a linguistic or communicative capacity comparable to ours. (3) This is not to deny that communication systems of various kinds are easy to observe in other species, but none of these systems seem to have the structural complexity we can observe in human language. Indeed it could be argued that language is not just unique to our species, but a defining property of it. The official biological name of our species (in the Linnean taxonomy) is *Homo sapiens*, Latin for 'wise man'. Since (4) a glance at a history book or a newspaper leads one to question the wisdom of our species, one could think that *Homo loquens* ('talking man') might have been a better term to define us.

As just mentioned, the general concept of language, roughly defined above, should be distinguished from individual languages. An individual language can be taken to be a specific variant of the uniquely human capacity defined above, usually part of a given culture: English, French, Italian, etc. Concepts such as 'English' are thus, at least in part, cultural concepts. The distinction between language (in general) and languages (individual

languages as partly cultural entities) distinguishes two variants of a single word in English. This is rather like the way we can distinguish the general concept of cheese from individual cheeses such as Brie, Cheddar, Parmigiano Reggiano and so on. *Language* and *cheese* are mass nouns; they mean general concepts. Individual cultures in different parts of the world produce their local variants of the general thing, associated with countable versions of the same nouns, i.e. individual languages and cheeses.

設問 1 下線部(1)と(2)について，二つの違いがわかるようにそれぞれを本文に基づいて日本語で具体的に説明しなさい。

設問 2 下線部(3)の指している内容を，本文に基づいて日本語で説明しなさい。

設問 3 下線部(4)を日本語に訳しなさい。

Ⅳ 次の英文を読み，設問に答えなさい。

It's a burning hot summer afternoon. As you run up the field, your heart and lungs are working twice as hard as usual, and your blood is moving five times as fast. Your legs hurt, and you feel very, very tired, but you can't stop now. Suddenly, the ball is coming towards you, turning in the air. (1)脳が思考している間，目はそれを追う: Where will it be a moment later? How can I reach it? Where are all the other players?

You jump: nerve signals shoot through your body, and hundreds of muscles in your legs, arms, back, and stomach move together to push you into the air. At just the right moment you push your neck forwards, and your head hits the ball. It flies into the goal at 60 kilometres per hour! As you run back down the field, six pairs of muscles move in your face, and you smile. You don't feel tired any more. Your body wants you to forget the pain and feel good — so you can go on and win the game.

(2)夕方，あなたは眠っているが，体は懸命に働いているだろう. It will mend the damage that you did to your muscles in today's match, and do a thousand other things to keep you alive. Your body will make new skin and new blood, your muscles and your hair will grow, and in the eight hours before you wake up, your heart will beat 33,000 times. In the morning, you may hurt all over, but you will be ready to start a new day.

Under your skin there is an extraordinary world full of tiny living things called cells — the smallest parts of any animal or plant. (3)人間の細胞は何百種類もあり，身体のあらゆるものがそれらでできている: from your eyes and your heart to your skin and your teeth. Your body is like an amazing machine, with 100 trillion living, working parts. But unlike machines, you can think and feel. So how does your body work? How does it make you who you are? And (4)うまくいかないと何が起こるのか?
