令和７年度（前期日程）
入学者選抜学力検査問題

英　　語　（120分）

〔注意事項〕

1. 監督者の指示があるまでこの冊子と解答用紙を開いてはいけません。
2. この冊子の問題は11ページからなっています。また，解答用紙は４枚，下書用紙は２枚あります。監督者から解答開始の合図があったら，この冊子，解答用紙，下書用紙を確認し，落丁・乱丁および印刷の不鮮明な箇所などがあれば，手をあげて監督者に知らせなさい。
3. **解答用紙には受験番号を記入する欄がそれぞれ２箇所ずつあります。監督者の指示に従って，すべての解答用紙（合計４枚）の受験番号欄（合計８箇所）に受験番号を必ず記入しなさい。**
4. この冊子の白紙と余白は適宜下書きなどに使用してよろしい。
5. **解答は必ず解答用紙の指定された場所（問題番号や設問の番号・記号などが対応する解答欄の中）に記入しなさい。なお，指定された場所以外や裏面への解答は採点対象外です。**
6. 解答用紙は持ち帰ってはいけません。
7. この冊子と下書用紙は持ち帰りなさい。

I **Read the following text and answer questions 1-12 based on what is written in the text. The explanatory notes for the words marked with an asterisk (*) are provided after the text.** (配点率 36%)

About three thousand years ago in China, the strategic board game "Go" was developed. Some believe military leaders based it on the stones they'd place on maps to determine their battle plans. Besides being the oldest continually played board game in human history, it's also one of the most complex. In modern times, winning against this game became a near-impossible task for the artificial intelligence (AI) community. The number of possible placements on the board is almost unlimited, and so it was believed computers didn't have the processing power needed to beat a skilled human player.

To face this challenge, scientists built an AI program called AlphaGo. The program learned to play by teaching itself, studying more than 100,000 past games. It then played against itself over and over until it was ready to challenge the current champion of the game.

In the 37th move* of the second match, the machine was faced with a decision that would determine the way the rest of the game would be played. It appeared that there were two choices to be made. Choice A was the kind of move that would signal the computer was playing a game of offense. Choice B would signal it was playing a defensive game.

Instead, the computer decided to make a third move, a move no one knowledgeable of the game had ever made in thousands of years of play. "Not a single human player would choose move 37," one commentator said. Most thought it was a mistake or simply a bad move.

The current champion playing against the machine was so shocked that he stood up and walked out of the room. He eventually returned, not with his usual confident attitude but visibly shaken and frustrated by the experience. AlphaGo won the game. That never-been-seen-before move, experts said, was the one that turned the course of the game in favor of the AI. In the end, the computer won four out of five matches, and the current champion permanently retired from competition.

Upon first hearing this story, I found myself in tears, and confused by this sudden emotion. After further reflection, I realized that the story spoke to the power of purity in the creative act. What was it that allowed a machine to devise a move no one had ever made in thousands of years of play?

It wasn't necessarily its intelligence. It was the fact that the machine learned the game

with no direct human intervention, no coach, and no lessons. The AI did not follow the accepted rules with the cultural norms attached to them. It didn't take into account the three-thousand-year-old traditions and conventions of Go. It didn't accept the narrative of how to properly play this game. It wasn't held back by limiting beliefs.

AlphaGo was able to innovate, devise something completely new, and transform the game forever. If it had been taught to play by humans, it most likely wouldn't have won the tournament. One Go expert commented, "After humanity spent thousands of years improving our tactics, computers tell us that humans are completely wrong ... I would say not a single human has touched the edge of the truth of Go."

To see what no human has seen before, to know what no human has known before, to create as no human has created before, it may be necessary to see as if through eyes that have never seen, know through a mind that has never thought, and create with hands that have never been trained. This is beginner's mind—one of the most difficult states of being for an artist, precisely because it involves letting go of what our experiences have taught us.

Beginner's mind is starting from a pure childlike place of not knowing; living in the moment with as few fixed beliefs as possible; seeing things for what they are as presented; tuning in to what excites us in the moment instead of what we think will work; and making our decisions accordingly. Any preconceived ideas and accepted customs limit what's possible.

We tend to believe that the more we know, the more clearly we can see the possibilities available. This is not the case. The impossible only becomes accessible when experience has not taught us limits. Did the computer win because it knew more than the current champion or because it knew less?

There's a great power in not knowing. When faced with a challenging task, we may tell ourselves it's too difficult, it's not worth the effort, it's not the way things are done, it's not likely to work, or it's not likely to work for us. If we approach a task with ignorance, it can remove the barricade of knowledge blocking progress. Innocence brings innovation. A lack of knowledge can create more openings to break new ground.

The past can be a teacher, offering tried and true methods, familiarity with the standards and awareness of potential risks. However, it also stops us engaging innocently with the task at hand. The more ingrained* your adopted approach, the harder it is to see past it. Though experience doesn't rule out innovation, it can make it more difficult to access.

Children make decisions without difficulty. Their actions are typically driven by innate instinct rather than learned behavior. This primitive force packs an ancient wisdom that

science has yet to catch up with. These childlike superpowers include being in the moment, valuing play above all else, having no regard for consequences, being honest without consideration, and having the ability to freely move from one emotion to the next without holding on to a story. For children, each moment in time is all there is. No future, no past. I want it now. I am hungry. I'm tired.

The great artists throughout history are the ones able to maintain this childlike enthusiasm naturally. Just as an infant is selfish, they're protective of their art in a way that's not always cooperative. Their needs as a creator come first. Often at the expense of their personal lives and relationships.

Accessing childlike spirit in our art and our lives is worth aiming for. It's simple to do if you haven't developed too many fixed habits and thoughts. If you have, it's very difficult. Nearly impossible. A child has no set of rules it relies on to make sense of the world. It may serve you to do the same. Any label you assume before sitting down to create, even one as basic as sculptor, musician, author, or entrepreneur, could be doing more harm than good. Remove the labels. Now how do you see the world?

Try to experience everything as if for the first time. If you grew up in a landlocked town, far away from the ocean, that you had never left, the first time you traveled and saw the ocean would likely be a dramatic, awe-inspiring experience. If you spent your whole life living near the ocean, your experience of it would almost certainly be less dramatic.

When you see what's present around you as if for the first time, you start to realize how astonishing it all is. As artists, we aim to live in a way in which we see the extraordinary hidden in everyday things. Then challenge ourselves to share what we see in a way that allows others to see this remarkable beauty.

Notes:

move: (将棋や囲碁などの)一手

ingrained: 深くしみついた

Question 1. What is the historical significance of the game Go?

A. It is the earliest board game that is still played by people today.

B. It is the first board game to use dice.

C. It was created by Roman generals for strategic purposes.

D. It was the first board game played by AI.

Question 2. How did the AI program AlphaGo learn to play the game of Go?

A. By following traditional Go manuals.

B. By observing professional Go matches live.

C. By studying with human coaches.

D. By teaching and playing against itself.

Question 3. What was unique about AlphaGo's move 37 in the second match against the current champion?

A. It was a defensive move never seen before.

B. It was a mistake that led to the current champion's victory.

C. It was a move recommended by past champions.

D. It was a new move that did not follow traditions or conventions.

Question 4. Why did the current champion retire from competition after playing against AlphaGo?

A. He believed he had mastered the game.

B. He wanted to train other players.

C. He was offered a better opportunity elsewhere.

D. He was upset by the experience.

Question 5. How can approaching a task with ignorance be beneficial?

A. It helps remove barriers to progress.

B. It increases our knowledge.

C. It limits the possibilities available.

D. It makes the process predictable.

Question 6. What is one advantage of experience mentioned in the text?

A. It allows us to engage in tasks with a fresh perspective.

B. It encourages us to avoid patterns.

C. It increases excitement.

D. It provides us with basic knowledge of tasks.

Question 7. What is a potential disadvantage of relying on experience?

A. It makes breaking new ground for tasks impossible.

B. It increases the potential risks of tasks.

C. It removes the opportunity to engage innocently with tasks.

D. It rules out innovation.

Question 8. Which of the following is NOT mentioned as a childlike superpower in the text?

A. Being in the moment

B. Being radically honest without consideration

C. Having the ability to multitask

D. Valuing play above all else

Question 9. What is one reason children's emotions can change so easily?

A. They are taught to manage their emotions.

B. They consider future consequences.

C. They don't hold on to a story.

D. They have a deep understanding of their emotions.

Question 10. How might someone who has never left a landlocked town experience the ocean for the first time?

A. As a fantastic experience

B. As an uninteresting event

C. With indifference

D. With a sense of familiarity

Question 11. What is a way to realize how amazing your surroundings are?

A. See what's present around you as if for the first time

B. Spend time studying nature

C. Talk to people who have had different experiences

D. Travel to new places frequently

Question 12. For each of the following, explain in English. Do not copy complete sentences from the text.

(a) What role does the lack of preconceived notions and cultural norms play in AlphaGo's success? Explain in approximately 30 words.

(b) What are the key characteristics of "beginner's mind"? Explain in approximately 20 words.

Ⅱ 以下の文章を読み，後の設問（１～７）に日本語で答えなさい。なお，＊がついている語句には下に注があります。 （配点率 39%）

Thirty years ago, Bernie Krause made his first audio clip in Sugarloaf Ridge State Park, 20 minutes' drive from his house near San Francisco. He chose a spot near a creek* and an old tree. Many people loved this place.

As a soundscape* recordist, Krause had travelled around the world listening to the planet. But in 1993 he turned his attention to what was happening near his home. In his first recording, his sensitive microphones captured a large number of animal and bird sounds, as well as the sounds of the creek. Back then, Krause never thought of this as a form of data-gathering. He began recording ecosystem sounds simply because he found them beautiful and relaxing. Krause has ADHD* and found no medication would work: "The only thing that relieved the anxiety was being out there and just listening to the soundscapes," he says.

However, accidentally, he had begun to gather rich data. Over the next three decades he would return each April to the spot at the old tree, set his recorder down and wait to hear what it would reveal. But in April last year, Krause played back his recording and found something he had not heard before: total silence. The recorder had run for its usual hour, but picked up no birdsong, no rush of water over stones, no beating wings. "I've got an hour of material with nothing, at the high point of spring," says Krause. "What's happening here is just a small indication of what's happening almost everywhere on an even larger scale."

Animals produce a vast array of sounds: to find mates, protect territories, identify their children or simply by moving about. But traditionally, ecologists have measured environmental health by looking at habitats rather than listening to them. Krause developed the idea that the sound of healthy ecosystems contained not only the calls of individual animals, but a dense, structured weave of sounds that he called the "biophony."

In 2009, when Krause listened through his archive, he realised a story was emerging: a subtle but noticeable loss in the density and variety of natural sounds. At the same time, he began observing odd things happening in Sugarloaf Ridge. Leaves on some tree species were opening two weeks earlier than documented in historical records. This change meant that the migrating birds* following the Pacific Flyway were not easily able to find food along their route. Winter rain patterns had changed. Then in 2012, exceptional drought conditions started. California had been getting record hot temperatures and little rain. By 2014, northern California was experiencing its most serious drought in 1,200

years, and the bird song in Krause's recording becomes muted. In 2015, the quiet sets in. There are no sounds from the creek or wind in the audio. In 2016, the quiet is broken only by the call of a small bird, a purple finch*.

"A great silence is spreading over the natural world even as the sound of man is increasing and becoming deafening*," Krause wrote in 2012, in his book *The Great Animal Orchestra.* The sense of destruction and loneliness extends beyond mere silence.

One of the most significant environmental books of the 20th century is *Silent Spring* by Rachel Carson. Published in 1962, it warned that if people did not stop their destruction of nature, especially through the use of chemicals such as DDT, the number of birds and other wild creatures would continue to decline and silence would begin to fall over the natural world.

In Krause's recording from April 2023, not only is the birdsong missing, but there is no water in the creek either. "We're watching this in our own lifetime, which is startling," he says. In 2019, Krause argued that the climate crisis could be changing the acoustic fabric of the Earth's natural sounds. He drew an analogy between the natural world and a concert hall: if the heat and moisture of the concert hall changed, so too would the players' ability to perform. "The same is happening for Earth's orchestra. New atmospheric conditions are changing natural sounds," he wrote. "Only major actions will help preserve Earth's beat."

Some of the reasons people were first attracted to Sonoma county*, where most of the state park lies, were to go fishing, hunting and swimming in the creeks. In the 1970s there were many places to swim, says Steven Lee, a research manager at Sonoma Ecology Center. "People don't swim in the creeks here any more. Why not? Because there's not enough water."

The biodiversity associated with the streams has also been lost. Chinook salmon and steelhead trout are unable to lay their eggs if there is no water. "It's definitely drastic," says Lee, about the changes in Krause's latest recording. "The pessimist in me would say that we're probably going to see a lot of these declines continue to happen." Waterways are critical lifelines for wildlife in dry places such as California, with a great deal of life depending on them. Droughts mean this lifeblood no longer flows through the landscape.

The drought is not the only pressure. Across the state, human activity is cutting into animal food sources and habitats. Wild places are being converted into farmland and urban areas, and invasive species* are becoming more common. Some of the songbirds Krause captured in 1993, such as the orange-crowned warbler*, are now in widespread decline.

Caitlin Cornwall, a project manager at the Sonoma Ecology Center, says: "There is a direct link between reversing climate change and having more birds in Bernie's recordings." Many of the birds captured in Krause's recordings are migrant species "living in danger," says Cornwall. "If one year many birds have died in a particular place, then the next year the young—and even the adults—might not come back." It could take generations for them to recolonise a habitat—assuming they survive elsewhere.

Krause, who has been recording ecosystems from Africa to Latin America to Europe, says it is depressing to hear how the places he visits have changed. His personal library contains more than 5,000 hours of recordings, taken over 55 years from all over the world. He estimates that 70% of his archive is from habitats that have now disappeared. "The changes are profound," he says. "And they are happening everywhere." "I've got to this point in my life now where I just don't know quite how to handle it, or how to express it, or what to say—yet I've got to tell people what I see and what I hear. Actually, I don't need to say anything—the messages are revealed through the sounds."

There have been some optimistic signs at Sugarloaf Ridge. The park manager has 40 cameras, which have taken 60,000 photos in the park over the past five years. He says there are hopeful indications, such as black bears and mountain lions* moving into the area. Krause is 85 now and says his hearing days are numbered: he is almost totally deaf in his right ear and has some hearing loss in his left. He can no longer hear subtle changes in sound like he used to. "That's a loss that I quite regret but have learned to live with," he says.

Still, he looks forward to spring and to his next recording in Sugarloaf Ridge. He is hopeful that this year there could be signs of improvement. "The stories conveyed through the voices of these creatures will tell us all we need to know that's worthwhile," he says. "When we finally learn how to listen."

【注】

creek: 小川

soundscape: 環境の中で音を風景として捉えようとすること。ある環境で人間・動物・自然などが出す音の総体を指す。例えば，海岸という環境においては，波，風，鳥，子どもたちなどが出す音の総体を指す。

ADHD: 注意欠陥多動性障がい

migrating birds: 渡り鳥

purple finch: ムラサキマシコ，北米の開けた林や灌木林(かんぼくりん)などに生息する小鳥

deafening: 耳をつんざくほど，ものすごく騒々しい

Sonoma county: ソノマ郡(カリフォルニア州)

invasive species: 外来種

orange-crowned warbler: サメズアカアメリカムシクイ，北米の灌木林に生息するくすんだ黄緑色の小鳥

mountain lion: クーガー，ピューマ，アメリカライオン

設問1　Krause 氏は，30 年間，家のそばで自然界の音を録音してきました。2023 年(本文中では「去年」) 4 月の録音はどのようなものだったか，30 年前の初回の録音と対比して記述しなさい。

設問2　自然環境が健全な状態か否かを調べる際の方法として，従来のエコロジストと Krause 氏はどのような点で異なりますか。両者の違いを述べなさい。

設問3　下記の表は，2009 年から 2016 年までの間に Sugarloaf Ridge やその周辺で見られた変化をまとめたものです。2012 年から 2014 年までに起こった変化をまとめなさい。

	自然界における気になる変化
2009	些細な変化ではあったが，明らかに，自然界の音の深みと多様性が失われた。同時に，Sugarloaf Ridge State Park では，ある特定の木が例年よりも 2 週間早く葉を広げるという奇妙な現象が見られ，そのせいで，Pacific Flyway を飛んでくる渡り鳥が容易にその木の実を見つけて食べることができなくなった。さらに，冬の雨の様相も変わった。
2012 -2014	〔　　〕
2015	小川の流れる音や風の音は採取できなかった。
2016	聞こえるのはムラサキマシコの声だけとなった。

設問4　Krause 氏は，コンサートホールの比喩を用いてどのようなことを説明していますか。

設問5　干ばつ以外に生態系に悪影響を与えるものは何だとありますか。できるだけ詳細に答えなさい。

設問6　Krause 氏が 55 年以上にわたって採取してきた自然界の音のデータから，どのような変化が明らかになりましたか。

設問7　Sugarloaf Ridge で見られる optimistic signs とは具体的に何を指しますか。

Ⅲ **If you could spend a day with a famous person from the past, who would it be, and why? Write a 150-200 word essay in English.** (配点率 25%)

(以　上)
