前期 **文系**

2025年度入学試験学力検査問題

英　　語

〔法学部，経済経営学部：経済経営学科 一般区分，
都市環境学部：都市政策科学科 文系区分　60分〕

答案用紙　　**1枚**

注　　意

1. 監督員の合図があるまで，問題の内容を見てはいけません。
2. 答案用紙に，正しく記入・マークされていない場合は，採点できないことがあります。
3. 解答には黒鉛筆またはシャープペンシルを使用し，答案用紙の解答欄にマークしなさい。例えば，［10］と表示のある問いに対して③と解答する場合は，次の(例)のように**解答番号10の解答欄の③にマーク**しなさい。

(例)

解答番号	解答欄				
	1	2	3	4	5
10	①	②	●	④	⑤

4. 試験中に不鮮明な印刷等に気付いた時は，手をあげて監督員に申し出てください。
5. 答案用紙を切り取ったり，持ち帰ったりしてはいけません。
6. 問題冊子の余白は利用可能ですが，どのページも切り離してはいけません。
7. 問題冊子は，持ち帰ってください。また，試験終了時刻まで退室できません。

第１問　次の英文を読み，設問に答えなさい。

It's no secret that human activities have put many of this planet's inhabitants in danger. Extinctions are happening at a dramatically faster rate than they have over the past tens of millions of years. An estimated quarter of all species on Earth are at risk of being lost, many within decades.

What can scientists possibly do to stop that trend? For some, the answer is to "de-extinct."

Colossal, a biotechnology company that garnered headlines for its plan to "de-extinct" the woolly mammoth, is now attempting to "bring back" the famously dead dodo bird. The company says its goal is to create a population of undead dodos to put on the Indian Ocean island of Mauritius, where the hefty, flightless creatures lived before humans drove them to extinction in the late 1600s.

As environmental humanists, we study the (　a　) of different conservation interventions, and are interested in how de-extinction might change the ways people think about their responsibilities toward nature. One of us, Ben, is a professor of environmental ethics who explores the ethics of de-extinction in his 2018 book *The Fall of the Wild*. The other, Risa, is a doctoral student researching how de-extinction might change public perceptions about extinction, especially its emotional impact.

De-extinction is not exactly what it sounds like. Rather than "bringing back" lost species, it's more of a process to create their high-tech look-alikes.

Scientists would edit the genomes of the dodo's closest living relative — the Nicobar pigeon, which contains the pigeon's full set of DNA — and add some of the most important dodo genes, taken from preserved dodo remains. Then they could put that genome into an egg cell, and let that egg develop into an organism that should look like a dodo.

But that organism wouldn't be genetically identical to the dodo. Nor would it (b) have any other dodos to teach it how to act like and, well, actually be a dodo.

Colossal hasn't successfully created any de-extinct creatures yet. Nor have any other scientists, (c) you count the team that cloned the Pyrenean ibex*1 in 2003 — but that clone died within minutes. And yet Colossal seems confident, saying it hopes to de-extinct Tasmanian tigers by 2025 and woolly mammoths by 2027. They're certainly amassing a fortune to make it happen. Since its founding in 2021, Colossal has raised over US$225 million from tech investors, Paris Hilton and even a CIA-backed venture capital firm.

Supporters have argued that de-extinction will eventually help restore ecosystems. "Bringing back" passenger pigeons could help restore forests in the northeastern United States, for example, while woolly mammoth proxies could help restore the Siberian steppe and keep permafrost*2 frozen. Some de-extinction advocates have also positioned their projects as potential long-term solutions to combating mass biodiversity loss in general.

But many ecologists and ethicists have highlighted the uncertainty around introducing these novel creatures into the wild. Even if the de-extinct dodos did act more or less like their extinct counterparts, it's hard to know how a habitat that hasn't had any dodo-like birds in it for 350 years would be affected by this new species. Opponents have (d) pushed back even more strongly against claims that de-extinction could be a widespread solution, pointing out how bringing back one species at a time would not be enough to curb the Earth's losses.

Other issues include how to decide where all these de-extinct creatures would live, as well as animal welfare concerns: for potential surrogate animals that would be impregnated, and the de-extinct creatures themselves, which never asked to be "brought back."

To us, one of the more interesting questions about de-extinction has to do with how it changes the way people think about extinction.

Some de-extinction boosters have argued that de-extinction could create a more hopeful story about humans' ability to combat mass extinction. Many others share the desire for more inspiring conservation stories, too. Some

conservationists and psychologists have argued that environmentalists need more positivity to get people engaged with environmental issues.

Others, however, say de-extinction isn't (e). Many worry that de-extinction actually risks making humans less inclined to care about ongoing extinctions. After all, why care about preventing extinction if we can eventually reverse it?

It's hard to rally the troops with a message of unrelenting guilt and despair. But reckoning with those difficult emotions can be useful for reflecting on humanity's responsibilities — especially considering that extinction is our fault to begin with, and since de-extinction isn't really "resurrecting" anything.

In fact, some scholars argue that what humans really need is to learn to grieve extinct species. Grief, they say, is a transformational process that helps people recognize the value of what's been lost and appreciate what's (f). Grief will never be enough without action. But we believe learning how to grieve together can be a more responsible and honest way to cope with extinction than pretending it can simply be undone.

So which is better at motivating care for the environment: positive or negative stories? There are still no sure answers, and testing their impact on audiences today is a key part of Risa's research. Perhaps it can help conservationists at large learn how to tell more motivational stories — but it will take some time to get there.

In the meantime, we suggest that de-extinction scientists and advocates (g) (really / it / what / call / is / de-extinction): not resurrecting extinct species, but creating their replacements.

"Should we bring back the dodo? De-extinction is a feel-good story,
but these high-tech replacements aren't really 'resurrecting' species,"
The Conversation (March 1, 2023)
(一部改変)

*1 Pyrenean ibex：ピレネーアイベックス(ヤギの亜種)

*2 permafrost：永久凍土層

問1 空欄(a)に入れるのにもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 [1]

① variety

② morality

③ probability

④ similarity

⑤ consistency

問2 下線部(b)の指すものを，次の①～⑤のうちから一つ選びなさい。 [2]

① the Nicobar pigeon

② the dodo

③ an egg cell

④ that genome

⑤ that organism

問3 空欄(c)に入れるのにもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 [3]

① unless

② while

③ although

④ provided

⑤ in that

問 4　Colossalという会社についての説明としてあてはまらないものを，次の①～⑤のうちから一つ選びなさい。 [4]

① It has attracted an abundance of funds from various sources.

② It made headlines for its de-extinction plan for the mammoth.

③ It is trying to create a group of the big birds that became extinct in the 1600s.

④ It is interested in the ethical aspects of various conservation actions.

⑤ It has not achieved its aim to create the woolly mammoth.

問 5　下線部(d)とほぼ同じ意味となる表現を，次の①～⑤のうちから一つ選びなさい。 [5]

① agreed much more candidly on

② admitted still more wholeheartedly to

③ resisted even more vigorously

④ distorted much more seriously

⑤ argued back and forth on

問 6　空欄(e)に入れるのにもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 [6]

① hopeful but misleading

② negative but positive

③ uninspiring or unfeasible

④ destructive or environmentally friendly

⑤ inefficient or idealistic

問 7　空欄(f)に入れるのにもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 [7]

① absent

② left

③ obtained

④ perceived

⑤ unseen

問 8　下線部(g)の単語を文意が通るように並べ替えたとき，4番目に来る単語を，次の①～⑤のうちから一つ選びなさい。 [8]

① really

② it

③ what

④ call

⑤ is

問 9　本文の内容とあきらかに一致しないものを，次の①～⑤のうちから一つ選びなさい。 [9]

① Some people think that de-extinction is one of the solutions to the current extinction crisis.

② De-extinction does not recreate extinct species but creates what looks very similar to them.

③ Some scientists plan to edit the genomes of the Nicobar pigeon in order to create dodo look-alikes.

④ Many ecologists agree that it would be desirable for de-extinct creatures to live in their original habitats.

⑤ De-extinction advocates have insisted that "bringing back" extinct species can restore ecosystems.

問10 筆者の考えや主張としてもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 10

① The writers are worried de-extinction will make people care too much about the environment.

② The writers believe de-extinction will be beneficial to the environment.

③ The writers believe we should bring back species, but not by de-extinction.

④ The writers think grief for extinct species must be condemned.

⑤ The writers have more interest in the impact on people's attitudes and emotions than on the methods of de-extinction.

英語の試験問題は次ページに続く。

第2問 次の英文を読み，設問に答えなさい。

No one in the Gould family of Westlake Village, California, was surprised by a study that suggested a person's age and stage of life may have a bigger impact on self-esteem than we ever realized. A study of about 350,000 people likens (a) a person's self-esteem across the human lifespan to a roller coaster ride, starting with an inflated sense of self-approval in late childhood that plunges in adolescence. Self-esteem rises steadily through adulthood, only to drop to its lowest point ever in old age. "I've gone through pretty much all of those cycles," Fred Gould said. At 60, he is edging toward retirement. Fred's wife, Eileen, 46, is a businesswoman in the throes of mid-adulthood and, according to the study, predisposed to a healthy self-regard. At 21, the Goulds' son, Jeff, has just launched that heady climb into adulthood and a buoyant self-regard after an adolescence fraught with (b) the usual perils*1 of self-doubt and hormonal warfare. His sister, Aly, 17, disagrees with a lot of the study, believing instead that each individual has an intrinsic sense of self-esteem that remains relatively constant. But she (　c　) agree that adolescence can give even the most solid sense of self-esteem a sound battering. "As a teenager, I can definitely speak for all of us when I say we bag on ourselves," Aly said.

The drop in self-esteem in adolescence was no surprise to Richard Robins, a psychology professor at the University of California at Davis, who spearheaded the study, but "the drop in old age is a little bit more novel," he said. Specifically, Robins was intrigued by the similarities in self-esteem levels between those entering adolescence and old age. "There is an accumulation of losses occurring all at once both in old age and adolescence," he suggested. "There is a critical mass of transition going on." (d)

Those answering the survey ranged in age from 9 to 90. They participated in the survey by logging onto a website during a period between 1999 and 2000. About three-quarters were Caucasian, the rest a mixture of people of Asian,

black, Latino and Middle-Eastern descent. Most were from the United States. The survey simply asked people to agree or strongly disagree — on a five-point scale — with the statement: "I see myself as someone who has high self-esteem."

Everybody is an individual, Robins stressed, so self-esteem can be affected by a number of things that are biological, social, and situational, but there are certain passages that all of us face — and each passage can have a powerful effect on our sense of self. "With kids, their feelings about themselves are often based on relatively (e) information," Robins explained. "As we get older, we base our self-esteem on actual achievements and feedback from other people."

Overall, the study indicated that women do not fare as well as men in self-esteem — a difference particularly marked in adolescence. "During adolescence, girls' self-esteem dropped about twice as much as boys'," Robins said, perhaps at least partially because of society's heavy emphasis on body image for girls. Add one negative life event to all of this turmoil, and a teenager's delicate self-esteem can crumble.

Eileen remembered having fairly high self-esteem from ages 12 to 16. She had been very ill as a child, so the teen years were a time for her to blossom. Then, her mother died when she was 17, and her self-esteem bottomed out. "I was like, 'What do I do? How do I handle this?'" Eileen remembered. Eileen was 22 when she married Fred, an event that coincided with the beginning of her adult years — and an upswing in her self-esteem. Like many adults, Eileen gained her senses of (f), both of which can contribute to the rise in self-esteem during the adult years, Robins said.

Even if there is divorce or some other form of chaos, there has been a change in our ability to cope, he said. We learn with experience. Fred is aware that his sense of self-esteem may be vulnerable when he retires. "I'm concerned about keeping my awareness level," he said. "Am I going to be aware of the social scene? Of things more global? Am I going to be able to read and (g) everything?"

Seniors do tend to experience a drop in self-esteem when they get into their 70s, the study says — but not always. This is enigmatic*2 to Robins. "When we look at things like general well-being, the evidence is mixed about what happens in old age," he said.

Some people experience a tremendous loss of self-esteem, whereas others maintain their sense of well-being right through old age. Others are not as lucky. Whereas adolescents lose their sense of childhood omnipotence*3, seniors experience another kind of loss. Retirement comes at about the same time seniors may begin to lose loved ones, their health, their financial status, or their sense of competence. Suddenly, someone who was so in charge may become withdrawn, sullen, and depressed. (h) Their self-esteem may plummet. Robins hopes the study will make us more aware of the times when our self-esteem can be in jeopardy.

(一部改変)

*1 perils：危険，危機　　*2 enigmatic：不可解な
*3 omnipotence：全能，無限の力

問1　下線部(a)の意味にもっとも近いものを，次の①～⑤のうちから一つ選びなさい。 [11]

① applies
② regulates
③ imitates
④ compares
⑤ defines

問 2　下線部(b)の意味にもっとも近いものを，次の①～⑤のうちから一つ選びなさい。 12

① filled with

② wishing for

③ irrelevant to

④ lacking in

⑤ resting with

問 3　空欄(c)に入れるのにもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 13

① should

② does

③ used to

④ cannot

⑤ does not

問 4　下線部(d)の文意にもっとも近いものを，次の①～⑤のうちから一つ選びなさい。 14

① Significant shifts in self-esteem are taking place.

② Individuals are experiencing fortunate life events.

③ We are faced with difficult and dangerous challenges.

④ We are beginning to adapt to a change in self-esteem.

⑤ We are undergoing the rise and fall of self-esteem.

問 5　空欄(e)に入れるのにもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 15

① academic

② exclusive

③ progressive

④ superficial

⑤ artificial

問 6　空欄(f)に入れるのにもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 16

① guilt and regret

② frustration and escape

③ competence and responsibility

④ humor and playfulness

⑤ property and wealth

問 7　空欄(g)に入れるのにもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 17

① do away with

② make fun of

③ go easy on

④ fall back on

⑤ keep up with

問 8　下線部(h)の文意としてもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 18

① Regardless of one's age, self-esteem is more stable than people realize.

② Young people will rarely lose their self-esteem during adolescence.

③ Adolescents regain their sense of infinite possibilities that they had during their early childhood.

④ After retirement, elderly people stop being aware of their own self-esteem.

⑤ People may experience a sudden decline in self-esteem in old age.

問 9　本文の内容と一致するものを，次の①～⑤のうちから一つ選びなさい。 19

① Sixty-year-old Fred Gould is approaching retirement and has experienced various kinds of jobs.

② Richard Robins, the psychology professor, was surprised by the drop in self-esteem in adolescence.

③ A businesswoman named Eileen is Fred's wife, and her self-esteem improved after her mother passed away.

④ The study showed that women have lower self-esteem than men, especially during adolescence.

⑤ Most seniors maintain their rather high self-esteem even if they have low self-esteem when young.

問10 本文のタイトルとしてもっとも適切なものを，次の①～⑤のうちから一つ選びなさい。 20

① The importance of self-esteem in adolescence

② How different men's self-esteem is from women's

③ The impact of age and life stages on self-esteem

④ Self-esteem differs from person to person

⑤ How to increase self-esteem
